Abstract of WO03010726

The invention relates to an occlusion device for gaming machine display elements consisting of an opaque curtain (4) that can cover part of the display element (1) bearing the images (2) which can be seen through the machine screen at the end of each game. The inventive device is used to conceal said images (2) temporarily and to substitute them with other images disposed on the external face of said curtain (4). The curtain (4) is connected to an arm (5) having a ring (6) disposed at the end thereof which is mounted to rotate freely on a support (10). The flat ring (6) is provided with tothing (7) by means of which said ring receives the movement of a micromotor (9) which causes the curtain (4) to move between the operation and non-operation positions, said positions being defined by a pair of mechanical stops (11-11') or by the electronic control of a step-by-step-type actuation motor (9).
